density, though as high as 220 to the square mile, cannot be an over-estimate; it is below the average of the sample areas and much below the 450 found in one of them, which is by no means the densest in the reserve.

The geographical features vary from mountains to flat country. The rainfall, which coincides with the hot months, October to March, is very good on the hills. In the flat country to the north it is rather uncertain. The mountains have many springs, but neither of the two main rivers is navigable and there is little life in them. The people do not eat fish and have no river craft, though they speak of a bark canoe (*legugwa*) used in the old days. On the slopes of the hills there are forests and one is of magnificent cycads (Mujaji palms). The people have an intimate knowledge of the names, the qualities and the uses of the flora. Their dependence upon trees, shrubs, and grasses for food, economic purposes, and medicine is one of the most impressive aspects of their culture. The soil is a reddish, fairly fertile loam. At present there is hardly any game; but in any case the Lovedu were never great hunters, and knowledge of the fauna is now of small use. The temperature is never excessive; the summer rains cool the hot air and the cold winds are easily subdued by bright sunshine. Summer merges into winter and winter overlaps summer; there is no well-marked spring or autumn. The people are agriculturists rather than pastoralists; the few cattle they have and the more numerous goats are not considered so much as food but rather as pivots of social relationship.

The people of the royal group, the nucleus of the tribe, live mostly on the mountains; the valleys and flats are occupied by Shangana-Tonga, recent-comers who are despised by the Sotho, and by the Roka, residents of the flats, looked upon as somewhat inferior though of diverse Sotho ancestry. The nuclear group or Lovedu proper are not numerous. Their group name, *khwevo*, is what we may call the surname of one in every ten people in the reserve. Other *khwevo*, 'brothers' of the Lovedu, rule such tribes as those of Sekhopo, Mamaila and Rakwadu, but many are scattered among dozens of alien tribes. In the whole Lovedu lowveld the *khwevo* are much less than 10 per cent. of the population.

The non-nuclear groups in the reserve are accretions from outside (if we except the Khigoa, the Dgona and some Lions and Elephants who either were in the country or came with the Lovedu). They have been

and the country mountainous, stationed themselves in a body at a single spot in the valley to which the people were then called. The new arrangements caused confusion and many of those who had collected in their districts dispersed to their homes and never presented themselves for enumeration. In addition, large numbers, as is their habit in the face of European intervention, secreted themselves in the bush. European eye-witnesses estimate that only 35 to 40 per cent, say 36·5 per cent, were actually enumerated, but Natives place the figure as high as 50 per cent. Taking the average of 43·25 per cent, we arrive at a total population for the reserve of 15,238 × 100 ÷ 43·25, or 35,232. (3) The number of taxpayers in the Lovedu location, which is about 4,000. On the accepted basis of calculation, the location population would be 4,000 × 5, or 20,000—that is 1·72 times that of the census figure of 11,636, and the total for the reserve may be calculated as 15,238 × 1·72 or 26,209. Finally, averaging the three figures, 36,207, 35,232 and 26,209, we get 32,549 or, to the nearest thousand, 33,000, which is the figure we adopt.
